

Hi @xxxxxxxxxxx,

When you set a password for your Twitter account, we use technology that masks it so no one at the company can see it. We recently identifie d a bug that stored passwords unmasked in an internal log. We have fix ed the bug, and our investigation shows no indication of breach or mis use by anyone.

Out of an abundance of caution, we ask that you consider changing you r password on all services where you've used this password. You can change your Twitter password anytime by going to the password settings page.

## **About The Bug**

We mask passwords through a process called hashing using a function known as bcrypt, which replaces the actual password with a random se t of numbers and letters that are stored in Twitter's system. This allows our systems to validate your account credentials without revealing you r password. This is an industry standard.

Due to a bug, passwords were written to an internal log before comple ting the hashing process. We found this error ourselves, removed the p asswords, and are implementing plans to prevent this bug from happe ning again.

## **Tips on Account Security**

Again, although we have no reason to believe password information ever left Twitter's systems or was misused by anyone, there are a few steps you can take to help us keep your account safe:

1 Change your password on Twitter and on any other service wherey ou may have used the same password.

- 2 Use a strong password that you don't reuse on other services.
- 3 Enable login verification, also known as two factor authentication. This is the single best action you can take to increase your account security.
- 4 Use a password manager to make sure you're using strong, unique passwords everywhere.

We are very sorry this happened. We recognize and appreciate the trust you place in us, and are committed to earning that trust every day.

Team Twitter
